

Get that salt back!

You will need:

- Set-up from yesterday with the string and the cups
- Warm water
- Salt
- Spoon
- Saucer/Plate/Bowl

What to do...

- Fill both cups with 100mL warm water (about half a cup) making sure that the thread/string is completely immersed in the water.
- Add at least 5 tablespoons of salt to each cup and stir till the salt dissolves.
- Now rest the wet string in a saucer/plate.
- Leave the set-up untouched for one day.

The next day you will see salt crystals appear on the thread. The longer you leave it to crystallize, the more salt you will recover from the salt solution. The water from the salt solution gets absorbed into the thread. When we leave it untouched for a long time, the water from the thread will evaporate into the air leaving behind only the salt.
